

CSS

Assignment

Assignment

Q1: What is padding and margin and when do you use them?

👉padding and margin is part of box-model.

We are using padding when we want the distance or space between the border of the box and content inside the box.

We are using margin when we want distance or space around our element.

Q2:What is display property? and explain display inline, block, and inline-block.

👉display property describe the display style of element.

👉Display inline : it displays an element as a normal inline element like span.here width and height will have no effect.

👉Display Block:it displays an element as a normal block element like p or div.

👉Display inline-block:it displays like a span tag but we can give height and width to the element.

Q3:Explain min-height, min-width, max-height, and max-width in CSS?

Min-height set minimum height of element. Now height should not be less than min-height.

Man-height sets the maximum height of the element. Now height should not be greater than max-height.

If min-height and max-height both are available then height of element must be inside this range. if it is greater then this range height will stop at max-height and if we decrease height it will stop at min-height.

Min-width and max-width also have the same concept as height.
